

# Ductless Heat Pumps

**Save money and energy all year with a new high efficiency heating and cooling system.**

**Electric heat pumps are one of the most efficient heating systems available.\***

Through October 1, 2016, all NPU customers are eligible for rebates of up to \$600 per ton on qualifying ductless heat pumps and central air systems.

Customize your system to heat and cool the areas of your home or business that you use the most. Each indoor unit is individually controlled, providing flexibility and comfort. Acting as dehumidifiers with built in air filters, electric heat pumps help keep the air in your home or business dry and can reduce mildew and airborne dust.

These units can provide heating and winter and cooling in the summer; systems that provide *both* heating and cooling produce quicker paybacks. No ductwork required means they're easy to install and eliminates the potential loss of energy (and money!) from leaking or unsealed ducts.

Electric heat pumps can lower energy costs by an average of 30% compared to standard heating and cooling systems. Electric heating customers are eligible for an additional \$500 incentive.

Residential Customers: Financing for your project is available through the Smart-E Loan product available at Eastern savings Bank and CorePlus Federal Credit Union. Additionally, your system may be eligible for a \$300 federal tax credit.
